

documentId should be used instead of id in Content API calls

In Strapi 5, the underlying API handling content is the [Document Service API](#) and documents should be called by their `documentId` in Content API calls (REST API & GraphQL).

This page is part of the [breaking changes database](#) and provides information about the breaking change and additional instructions to migrate from Strapi v4 to Strapi 5.

🔌 Is this breaking change affecting plugins? **Yes**

🤖 Is this breaking change automatically handled by a codemod? **Partly**

Breaking change description

In Strapi v4

Entries were identified by their `id`:

```
{
  "data": {
    // system fields
    "id": 14,
    "attributes": {
      // user fields
      "title": "Article A"
      "relation": {
        "data": {
          "id": "clkgyLw7d000108lc4rw1bb6s"
          "name": "Category A"
        }
      }
    }
  }
}
```

```
"meta": {  
  // ...  
}  
}
```

In Strapi 5

Documents are identified by their `documentId`:

```
{  
  "data": {  
    // system fields  
    "documentId": "clkgylmcc000008lcdd868feh",  
    "locale": "en",  
    // user fields  
    "title": "Article A"  
    "relation": {  
      // system fields  
      "documentId": "clkgylw7d000108lc4rw1bb6s"  
      // user fields  
      "name": "Category A"  
    }  
  }  
}  
"meta": {  
  // ...  
}  
}
```

Migration

Notes

- This breaking change impacts routes and relations.
- To ease the transition from v4 to Strapi 5, API calls to entries might still include an `id` field in their response, especially with the [Document Service API](#). But it's recommended that you start making an habit of using `documentId` instead of `id` as it will ease handling the transition to future Strapi versions.

Migration procedure

A codemod will partly handle the change, but might probably add `__TODO__` items to your code since it's impossible for the codemod to automatically guess the new `documentId` of your content.

For additional information, please refer to the related [breaking change entry](#), the [step-by-step guide](#) to upgrade to Strapi 5, and the dedicated migration guide for the [Entity Service API to Document Service API transition](#) if this applies to your custom code.
